

# Absolute pressure gauge, stainless steel

## High overload safety

### Models 532.52, 532.53 and 532.54

WIKA data sheet PM 05.02

for further approvals,  
see page 6

### Applications

- Pressure measurement independent of fluctuations in the atmospheric pressure
- For gaseous, liquid and aggressive media, also in aggressive environments
- Monitoring of vacuum pumps
- Control of vacuum packaging machines
- Monitoring of condensation pressures and determination of vapour pressure in liquids

### Special features

- High overload safety
- Long service life due to metal media chamber sealing and the extremely gas-tight material of the reference chamber
- Instruments compatible with switch contacts
- Scale ranges from 0 ... 25 mbar absolute pressure

Absolute pressure gauge, model 532.52

### Description

These absolute pressure gauges are used when the pressure measurement needs to be carried out independently of fluctuations in the atmospheric pressure.

Based on the diaphragm element measurement principle, extremely low scale ranges from 0 ... 25 mbar absolute pressure are available. These measuring instruments, made entirely of stainless steel, are suitable for gaseous, liquid and aggressive media.

The instruments owe their high long-term stability and subsequent long service life to the special, extremely gas-tight material of the reference chamber.

Thus, the required vacuum can be maintained in the

reference chamber for a long time. A metal media chamber sealing also contributes to this.

In addition, depending on the scale range, this instrument features an overload safety of at least 1 bar absolute pressure. Depending on the version, the overload safety can be up to 20 times the full scale value, but a maximum of 25 bar absolute pressure.

For applications with shock or vibration loads, absolute pressure gauges with liquid filling can be used.

The qualification and production of the instruments is carried out in accordance with DIN 16002, which was developed with the cooperation of WIKA.

## Functionality

The pressure measurement in absolute pressure gauges always refers to the absolute vacuum in the reference chamber. This makes it possible to measure pressure independently of natural fluctuations in atmospheric pressure. The pressure element separates the media chamber from the fully evacuated reference chamber. The pressure element, the diaphragm element, is a circular, corrugated diaphragm. The diaphragm element is welded at the edge and is subjected to pressure on one side by the pressure in the media chamber.

The pressure difference between media chamber and reference chamber causes the deflection, and thus the measuring travel, of the diaphragm element. The measuring travel of the diaphragm element is transmitted to the movement by a metal bellows via the link and displayed on the dial with the instrument pointer.

### Overload safety

Independent of the scale range, the overload safety is at least 1 bar absolute pressure. This ensures that the ambient pressure (approx. 1 bar absolute pressure) cannot represent an overload.

Diaphragm elements can be subject to an overload of up to 20 times the full scale value, but max. up to 25 bar absolute pressure, through load take-up points (by bringing the diaphragm element up against the upper measuring flange). With this version, for example, in the scale range 0 ... 400 mbar abs., a short-term overpressure of up to 8 bar abs. would not be problematic and the accuracy would remain unaffected.

### Monel version

For extremely corrosive media, the wetted parts can be supplied from Monel.

## Specifications

Basic information	
<b>Standard</b>	
Absolute pressure gauges with diaphragm elements and capsule elements	DIN 16002
